possible data were obtained on the whites also in a school for whites on thursday island fifty children were examined wi
embarrassing situation was encountered with regard to the sensitiveness of the whites in the matter of having their chil
obtained for the facial development which reveal that out of the fifty children examined 64 per cent had irregularities of
upper half of fig 62 will be seen a group of children photographed in the native school and in the lower a group of white
difference in their facial development is readily seen the son of the white teacher fig 66 left had marked under developr
largely on canned food

Fig 62 school children from the two groups on thursday island note the beautifully proportioned faces of the natives and the pinched nostrils and marked disturbance in proportions of the faces of the whites the dental arches of the natives are broad while many of the whites have very crowded teeth the parents and children of the natives used native foods while the parents and children of the whites used the modern imported foods of commerce

Hammond island adloins thursday island sufficiently close by to be easily reached in small boats accordingly the people of this island have access to the stores of the white settlement on thursday island unlike thursday island hammond island is quite fertile of twenty seven individuals all of native stock 16 5 per cent of their 732 teeth had been attacked by dental caries and 40 per cent of the individuals showed some deformity of the dental arches after examining the children at the mission school i inquired whether there were not families on the island that were living entirely isolated from contact with modern influences i was taken to the far side of the island to an isolated family this family had continued to live on their own resources they were raising vegetables industrial conditions prompts one particularly in the cases of the three girls in the family one with a child five months of age only six of their eighty four teeth had been attacked by tooth decay or 7 1 per cent as compared with 16 5 per cent for the entire group on this island these three girls all had normally developed dental arches and normal features three of the girls are shown in fig 63 we inquired about the mother and were told that she was out fishing notwithstanding the fact that the sea was quite rough while we were there she came in with two fish fig 63 here was one of the principal secrets of their happiness and success in life the catholic priest who had charge of the mission on this island told me that this family practically never asked for assistance of any kind and was always in a position to help others they were happy and well nourished it is important to note that the progressive degeneration in facial form which occurred in many of the families on the other islands was not found in this family

On murray island where a store had recently been established of the 1 074 teeth examined for 39 individuals only 0 7 per cent of the teeth had been attacked by tooth decay for the women this amounted to 2 per cent for the men 1 7 per cent and for the children 0 26 per cent only 12 8 per cent of the group had dental caries it is significant that the natives were conscious of a danger from the presence on the island of a store providing imported foods this had been so serious a problem that there was a question whether it would be safe for us to land since on the last visit of the government officials blood was almost shed because of the opposition of the natives to the government s program the result of our examination indicates that dental caries on these islands shows an incidence which has an apparent direct relationship to the length of time government stores have been established there the immunity to dental caries on this island is nearly 100 per cent of the adults 14 3 per cent had abnormal dental arches and of the children 34 4 per cent

Back to Top

Thursday island is the location of the administrative center for the torres although it is the best sheltered harbor and affords protection for small boats in the torres strait it was not originally inhabited by the natives they considered it unfit for habitation because the soil was so poor that it could not provide the proper plant foods to be eaten with the sea foods which are abundant about all of the islands nearly all of the whites inhabiting the islands of this district live on this island they are the families of the administrative officers and of merchants who are engaged in the pearl industry owing to the infertility of the soil practically all of the food has to be shipped in except the little that the whites obtain from the sea on the island there were many native families with children attending the native school while their fathers worked in the pearling fleets thirty individuals in three fleets were examined and of their 960 teeth only thirty five had been attacked by dental caries or 3 6 per cent of these thirty individuals five or 16 3 per cent had abnormal dental arches the men who had teeth attacked by dental caries informed me that this had happened after they had engaged on the pearling vessels and began to use the foods provided there in the native school on thursday island twenty three children were examined they were living in homes in which a considerable part of the food was purchased at the company stores the incidence of tooth decay was 12 2 per cent of their 664 teeth many of these thursday island children had been born since their parents had begun using the commercial foods provided to the islanders among twenty three individuals 43 5 per cent had abnormal dental arches

While these investigations were planned and carried out primarily to obtain data on the condition of the native races in contact with modern white civilization wherever
